Medical Device Dispensing Applications Diaphragm Valve – DV509

The model DV509 Diaphragm Valve from Fisnar Inc. is a lightweight valve designed to dispense low to medium viscosity fluids with the important advantage of keeping the wetted parts separated from the operating air supply. This is particularly useful in dispensing Cyanoacrylate, reagents, UV adhesives and aggressive substances. Diaphragm valves with Stainless Steel and UHMW bodies are also available.

Micro shot sizes are fine tuned using the valve adjustment control. The valve design provides precise control and positive shut-off.

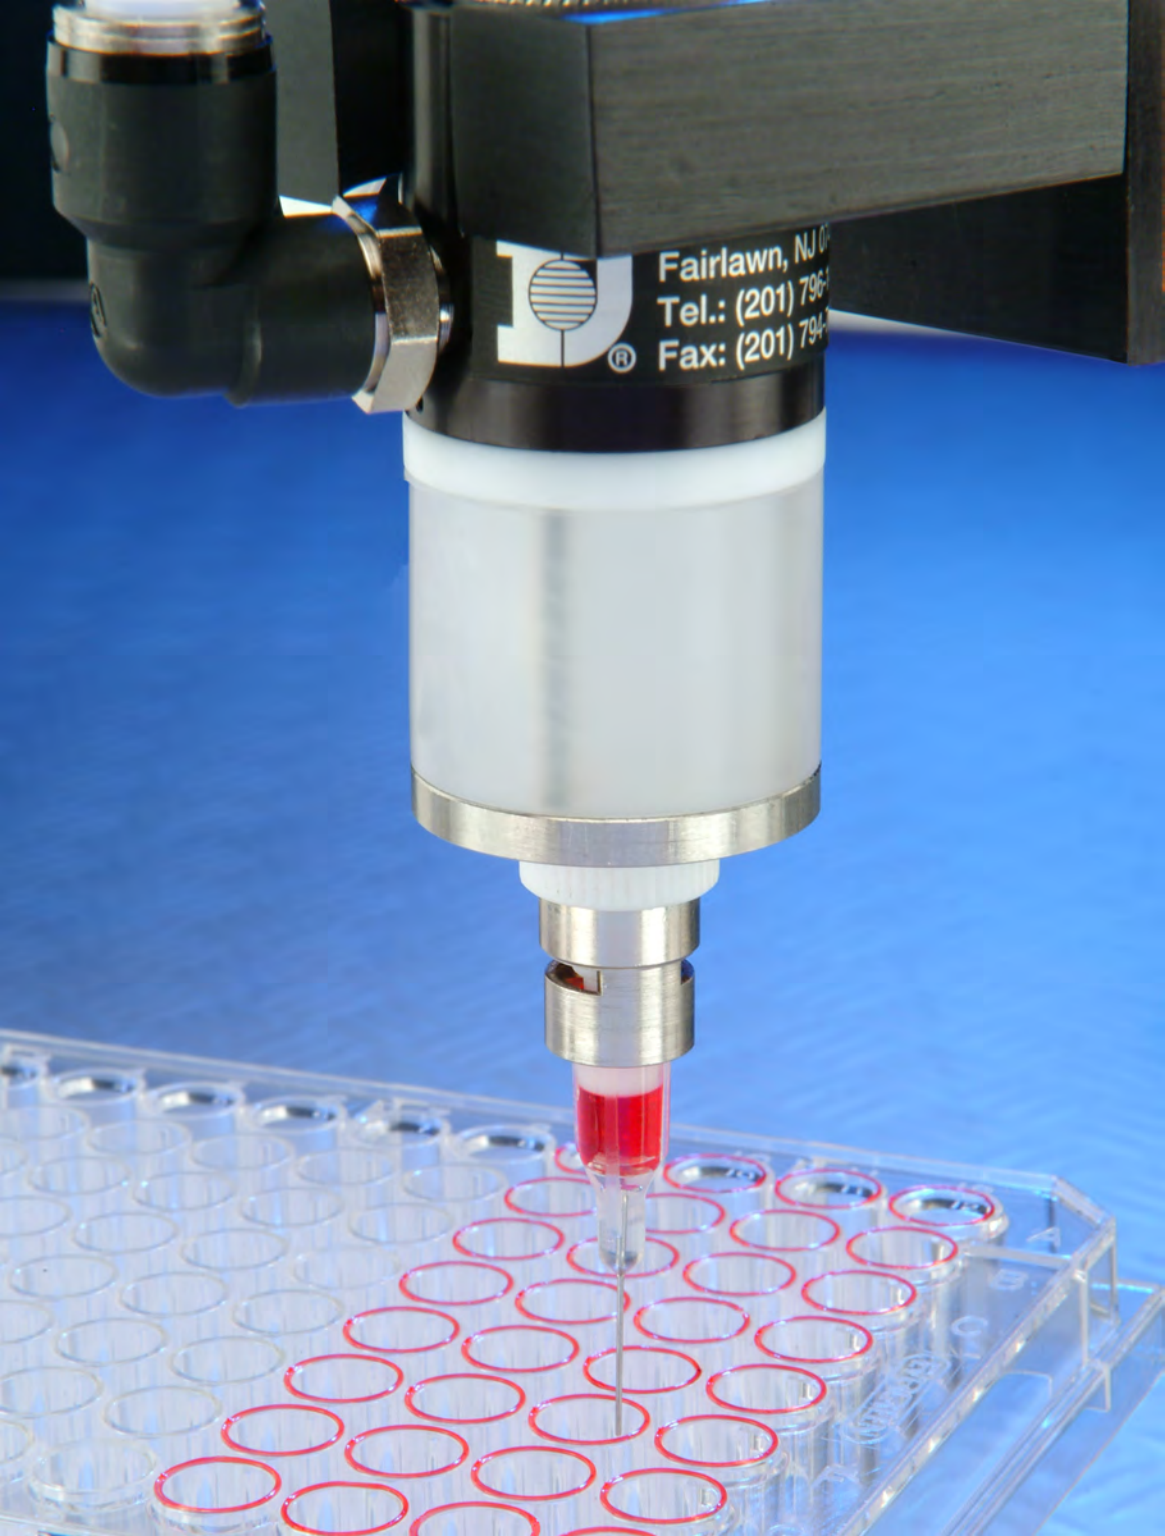

This lightweight, 3oz valve is capable of 200 cycles/minute and is of a robust integrity to withstand constant 24-hour production cycling.

The DV509 is one of a wide range of valves available from Fisnar Inc.

For further information on all of our dispensing solutions contact Fisnar Inc.
